

THE SCHOOL OF AI

NAVTTC

AI for Everyone

Week 1, Day 1 — Welcome, the course map, and what the AI job market actually looks like in 2026.

3 months · 4 hours a day · 20% theory, 80% practice · 08 September 2026 · Muhammad Rizwan

Four hours, four questions

By the end of today you will know why you are here, what you will learn, who has done it before you, and who pays for it.

1 Hour 1 · Why AI

Motivational session. What changed, and why 2026 is the year to learn this.

2 Hour 2 · The course

The 13-week map, the tools, the tasks, the tests and the final project.

3 Hour 3 · Proof

Pakistani people who built careers and companies with these exact skills.

4 Hour 4 · The market

Real job titles, real platforms, real numbers — and your homework for Day 2.

You do not need to be a programmer to earn money from AI.

You need to know what to ask an AI tool, how to check its answer, and how to join a few tools together so work happens without you. That is the whole course.

Pakistan is already earning from this

These are State Bank and platform figures for the financial year that ended in June 2026 — not predictions.

\$1.76bn

earned by Pakistani freelancers in FY2026 —
up 78% on the year before

\$4.6bn

total IT and IT-services exports in FY2026, an
all-time record

+109%

growth in client spending on AI skills on
Upwork, year on year

Sources: State Bank of Pakistan freelance remittance and IT export data for FY2025-26, reported July 2026 · Upwork In-Demand Skills 2026 report, published 4 February 2026. Figures date quickly — check before reusing.

Three doors, one skill set

You do not have to choose today. The same skills open all three, and many people end up using two at once.

DOOR ONE

Get hired

Offices, agencies and schools want staff who do ordinary work faster with AI. You keep your profession and add the skill.

DOOR TWO

Freelance

Sell AI services on Upwork, Fiverr or LinkedIn to clients abroad. Paid in dollars, working from home, starting with one small gig.

DOOR THREE

Build your own

Run AI inside your own shop, school or agency so one person does the work of three. Then sell that same system to others.

What this course is, and is not

Read the right-hand card carefully. Most people who fail at AI work fail for one of those three reasons.

This course is

Practical. You will spend four out of every five hours doing, not listening.

Built around 60 recorded tasks that become your portfolio.

Aimed at earning — freelancing, jobs and business use, not exam theory.

This course is not

A shortcut to fast money. The first paid client usually takes two to four months of steady effort.

A programming course. We use no-code tools, and the little code we touch is copied and explained.

Something that works by attendance alone. Daily practice outside class is what separates the trainees who earn.

Five things you will be able to do

This is the promise of the next three months. Every week's work feeds one of these five.

1	Use the tools well	Run ChatGPT, Claude, Gemini, Perplexity, Copilot and NotebookLM — and know which one to pick for which job.
2	Write real prompts	Use a five-part structure so the AI gives you work you can send to a client, not a first draft you must rewrite.
3	Build automations	Connect forms, email, Sheets and Telegram in n8n so routine work happens on its own, every day, without you.
4	Apply it to your work	Emails, reports, lesson plans, ad copy, proposals, customer replies — in your own profession and in Urdu where needed.
5	Sell the skill	A portfolio, an optimised LinkedIn and Fiverr profile, a service menu with prices, and a written proposal.

The thirteen weeks, in six stages

Each stage builds on the one before it. Nothing here assumes any earlier stage was skipped.

WEEKS 1–3

Understand and explore

What AI is, what it is not, and time inside every major tool.

WEEK 4

Prompt engineering

The five-element prompt, role prompting, and your own library.

WEEKS 5–6

Productivity and content

Email, reports, research, social media, blogs, SEO, ad copy.

WEEKS 7–9

Automation and n8n

Process mapping, then real workflows in n8n with AI steps.

WEEKS 10–11

Claude and Google AI

Claude Projects, Google AI Studio and the Gemini API.

WEEKS 12–13

Earning and capstone

Freelancing, LinkedIn, proposals, and your final project.

Six tools, six different jobs

All six have a free tier that is good enough to learn on. You will open accounts for the first three tonight.

ChatGPT

The all-rounder, and the one most clients will name.

Claude

Long documents. Best when tone and accuracy matter.

Gemini

Lives inside Gmail, Docs and Sheets. Strong on images.

Perplexity

Research with its sources attached, so you can check it.

Copilot

Microsoft 365 — Word, Excel, PowerPoint and Outlook.

NotebookLM

Answers only from documents you upload, and reads aloud.

What is current today

Tools have model names, and model names change every few weeks. Learn the habit of checking, not the list.

TOOL	NEWEST MODEL REPORTED, SEPT 2026	WHAT IT IS MAINLY USED FOR
ChatGPT	GPT-6 Astra; the GPT-5.6 family still widely served	General writing, images, everyday assistant work
Claude	Claude Fable 5.1; Claude Opus 5 below it	Long documents, careful analysis, agent workflows
Gemini	Gemini 3.8 Flash; free tier still on an earlier Flash	Google Workspace, very large documents, multimodal

This list will be out of date within weeks. That is normal.

What stays true is the habit: describe the job, pick a tool, check the output yourself.

Model line-up compiled from public model-tracking sites on September 2026. Verify on each vendor's own site before you rely on it.

Four changes that created these jobs

AI stopped being a chat window and became something that does work inside other software. That shift is what clients are paying for.

AI that takes actions

Tools no longer only answer. They read a file, fill a sheet, send the mail. The work is setting them up safely.

AI inside ordinary software

Word, Excel, Gmail and Canva all have AI built in. The paid skill is knowing which button saves a real hour.

No-code automation platforms

n8n and Zapier let one person join a form to a sheet to a message to an AI step. No degree required.

Cheap video, voice and images

AI video and editing grew fastest of any freelance category on Upwork in 2026. Small businesses cannot do it alone.

Category growth figure: Upwork In-Demand Skills 2026, published 4 February 2026 (AI video generation and editing, +329% year on year).

How you will be assessed

Nothing here is a surprise exam. Everything is work you have already done in class, kept in your file.

1	60 practical tasks	Annexure-I tasks, done in class or at home. Every one is saved in your file with your name, trade and session.
2	Four monthly tests	End of Weeks 4, 6, 9 and 11. Short and practical — you use the tools, you do not write essays about them.
3	Midterm project	Week 7: map a real manual process and design its automated version.
4	Capstone project	Six weeks from Week 8, alongside class. One of five project types, chosen with your trainer.
5	Final viva and competition	You present the project to industry professionals; the best ideas go forward to the NAVTTC incubation centre.

What you need to bring

Four things. None of them cost money.

Attendance

Four hours a day, every day.

A device

A laptop is best; a phone works early on.

An email account

A Gmail address opens every tool.

A task file

One folder, every task you finish.

Tonight: create accounts on ChatGPT, Claude and Gemini.

That is Task 3 in Annexure-I. Bring proof — a screenshot of each — to the start of Day 2.

People from here are already doing this work.

Three stories, at three different scales. Watch for what all three have in common — it is not talent, and it is not money.

From a bedroom to a billion dollars

The same country, the same decade, three very different starting points.

THE GLOBAL SCALE

Sualeh Asif

Pakistani-born co-founder of Cursor, the AI coding tool. Forbes listed him as a billionaire in April 2026, at 26. Started as a student building something he needed himself.

THE COMPANY SCALE

Pakistan's AI startups

Founders here are now raising money from a16z and Y Combinator, building AI tools for tax, finance and fundraising. Over \$93m was raised across Pakistani startups in Q1 2026 alone.

THE PERSONAL SCALE

The AI freelancer

The course case study: a Faisalabad data-entry worker who trained in prompts and n8n, then sold content automation on Upwork — around PKR 180,000 a month within six months.

Sources: Forbes Billionaires List via ProPakistani, April 2026 · Pakistani startup funding reporting, 2026 · Third story is the illustrative case study in Annexure-III of this curriculum.

What the first six months look like

Every success story compresses the boring middle. Here is the middle, from the Annexure-III case study.

3

months of learning tools and building a portfolio before sending a single proposal

40:2

proposals sent to replies received in the first month on Upwork

5

repeat clients by month four, after rewriting the proposal again and again

Rejection is the job, not a sign that you have failed at it.

Four habits, not four talents

Every story in this hour contains all four. None of them requires a background you do not already have.

They narrowed down

Not 'AI services'. One thing: content automation for marketing agencies. Narrow gets hired.

They built things

Portfolios made of real work, not certificates. Something a client could look at and understand.

They kept going

Past the silence, past the rejections, past the first month with no reply at all.

They asked and read

Forums, top profiles, other freelancers. They copied what was already working.

Demand is growing faster than supply

Three independent measurements, all from 2026, all pointing the same way.

#1

AI Engineer was LinkedIn's fastest-growing job title of 2026, with postings up 143%

2x

spending on AI-related freelance skills on Upwork more than doubled year on year

+329%

growth in AI video generation and editing — the fastest-growing category of all

Sources: LinkedIn Jobs on the Rise 2026 (United States) · Upwork In-Demand Skills 2026, published 4 February 2026, based on completed-job earnings through December 2025.

Five job titles this course aims at

Search these exact words on LinkedIn, Rozee.pk, Indeed, Upwork and Fiverr — that is Task 1, due on Day 2.

ROLE	WHAT YOU ACTUALLY DO ALL DAY	WHO HIRES
AI Prompt Engineer	Write and test prompt systems so a team gets consistent output	Agencies, software houses, content teams
Automation Specialist	Build n8n or Zapier workflows that remove repetitive work	SMEs, e-commerce, service businesses
AI Content Creator	Produce and repurpose written, visual and video content with AI	Marketing agencies, brands, creators
AI Digital Marketer	Run campaigns, ad copy and social calendars using AI tools	Local and international marketing teams
AI Consultant	Audit a business, recommend tools, set the systems up	SMEs, schools, clinics, small agencies

Six services, all taught in this course

Each one is a gig you can list on Fiverr. You will have done all six as class tasks by Week 12.

WEEK 6

Content calendars

A month of social posts, written, scheduled, on brand.

WEEKS 8–9

Email automation

Enquiries sorted, answered and logged automatically.

WEEKS 8–9

Lead capture systems

Form to sheet to alert to follow-up, running by itself.

WEEK 11

FAQ chatbots

An assistant built on a business's own documents.

WEEK 5

Report and doc writing

SOPs, proposals and manuals, in a fraction of the time.

WEEK 10

Research briefs

Checked market and competitor summaries, with sources.

The draft is easy. The judgement is not.

Clients are not paying for output — they can get that themselves. They pay for someone who can tell good output from bad.

What the tool is good at

First drafts at speed. Rewriting in a different tone. Summarising long documents. Translating. Producing twenty variations when you need choices.

What still needs a person

Knowing what the client actually wants. Catching the confident sentence that is simply false. Local context and Urdu nuance. Taking responsibility for what gets sent.

Two tasks, due tomorrow

Both are Annexure-I tasks. Both go in your task file. Bring them printed or on screen.

1

Task 1 · Search the market

Find five real AI or automation job titles advertised for Pakistan or remote work on LinkedIn, Rozee.pk or Indeed. Write down the title, the company and one skill each asks for.

2

Task 3 · Open your accounts

Create free accounts on ChatGPT, Claude and Gemini. Ask all three the same question, then write three lines on how the answers differed.

Suggested question for Task 3: "Explain what an API is to a shopkeeper in Lahore, in five sentences."

END OF DAY 1

**Nobody in this room starts ahead.
The gap is practice.**

Next · Day 2 — Institute and work ethics, then what artificial intelligence actually is, and how it differs from machine learning, deep learning, generative AI and agentic AI.
